DRYNAMO

Designed to meet the needs of demanding athletes, the Drynamo base layer is made with innovative warp knit technology with seamless engineered construction designed with intelligent body mapped targeted ventilation zones for enhanced breathability, comfort and fit.

During light sports activities, DRYNAMO controls the flow of perspiration vapour to keep the body's thermal regulation system well balanced and the skin dry.

During High intensity sports activities, Drynamo will transfer sweat away from the skin to the outside of the garment quickly and efficiently better than any other garment on the market.

ECO MERINO

For all outdoor activities in cold conditions, the naturally soft and breathable eco merino wool blend garments are the perfect next to skin base layer delivering optimum thermal regulation and function for winter activities.

Warp knit technology seamless engineered construction is designed with intelligent body mapped targeted ventilation zones for enhanced breathability, comfort and warmth.

The eco-merino base layers are reinforced with a biodegradable nylon which allows the garment to fit as a second skin and ensuring the garment keeps its shape over time through many wear/wash cycles.

While most garments will end up in landfill, this collection of base layers are created with end of life in mind. They are 96% biodegradable and the 4% lycra content is recycled.
